STRING UTILITY BOX – Mini Project Documentation

1. Introduction

The String Utility Box is a menu-driven program developed in the C programming language.

It performs different operations on strings such as finding the length, reversing, concatenating, comparing strings,

converting case, and counting words. This project helps users understand and practice basic string manipulation functions in C.

2. Objective

The objective of this project is to create a menu-driven C program that performs multiple string operations

within a single application. The program allows the user to find the length of a string, reverse a string, concatenate two strings,

compare strings, convert case (uppercase/lowercase), and count the number of words in a string.

3. Problem Statement

String operations are commonly used in programming. Instead of writing separate programs for each

operation, this project combines several string manipulation tasks into one interactive menu-driven application.

4. Modules of the Project

1. Main Module – Displays the menu, accepts user choice, and calls the required function.

2. Length Module – Finds and displays the length of the string.

3. Reverse Module – Reverses the given string.

4. Concatenate Module – Combines two strings.

5. Compare Module – Compares two strings and shows the result.

6. Uppercase Module – Converts all characters to uppercase.

7. Lowercase Module – Converts all characters to lowercase.

8. Word Count Module – Counts the number of words in a string.

9. Exit Module – Ends the program.

5. Program Flow

1. Start the program.

2. Ask the user to enter a string.

3. Display the menu with string operations.

4. User selects an option.

5. The program performs the selected operation.

6. Display the result.

7. Repeat until the user selects Exit.

6. Output Explanation

The program first asks the user to enter a string and then displays a menu with different operations.

Depending on the selected option, the program performs actions such as finding string length, concatenating strings,

comparing strings, changing case, or exiting the program.

7. Result

The program successfully performs multiple string operations through a simple menu-driven system.

8. Conclusion

The String Utility Box program efficiently demonstrates various string manipulation techniques in C.

It provides a user-friendly interface for learning and performing common string operations.
